

Forklift Fork Positioner

Forklift Fork Positioners - A fork positioner is actually a device made out of top quality materials intended to endure the most demanding operations and work environments. This particular piece of equipment enables the person driving to operate the blades hydraulically without leaving the seat. Side shifting models have the added ability to laterally position the arms or the entire load so as to facilitate more accurate carrying and position in a faster and more effective manner.

The only one of its kind fork pocket design can enable operators to safely sway the unit's forks without any worry of destroying the positioning cylinders. This could allow the worker the choice to either perform simultaneous or independent fork movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on existing units.
